Syllabus audit: this paper was clean

Every one of the 24 MCQs was written against the Student Learning Outcomes printed in Seemab's own textbook, and the SLO citation for each appears in the answer key and in the subject's coverage tracker. **Each of the questions she got wrong was re-checked after marking and all sit squarely on a stated SLO**, so every deduction here is genuine. Nothing on this paper came from another subject's book or from outside her studied chapters. This is the first paper built under the rule adopted after Physics exam-13.

Section A — Multiple Choice Questions (24 × 1 = 24 Marks) — 21/24

#	Question (abbreviated)	Hers	Correct	Syllabus reference	Result
1	Greek origin of the word Biology	A	A (life and study)	Ch1 SLO 1, §1.1.1	CORRECT
2	Branch studying animals	B	B (Zoology)	Ch1 SLO 3	CORRECT
3	Branch studying tissues	C	C (Histology)	Ch1 SLO 4	CORRECT
4	Variety of living organisms in an area	B	B (biodiversity)	Ch2 SLO 1	CORRECT
5	Third domain alongside Archaea and Bacteria	C	C (Eukarya)	Ch2 SLO 4	CORRECT
6	<i>Homo</i> in <i>Homo sapiens</i>	B	B (genus)	Ch2 SLO 7	CORRECT
7	Basic structural and functional unit of life	B	B (cell)	Ch3 SLO 1	CORRECT
8	Organelle controlling cell activities	B	B (nucleus)	Ch3 SLO 3	CORRECT
9	Unspecialized cells developing into other types	A	B (stem cells)	Ch3 SLO 10, "Define stem cells as unspecialized cells"	WRONG
10	Cell specialised for carrying messages	B	B (neuron)	Ch3 SLO 5	CORRECT
11	Phase in which DNA is replicated	B	B (S phase)	Ch4 SLO 1	CORRECT
12	Order of the stages of mitosis	A	A (P, M, A, T)	Ch4 SLO 2	CORRECT
13	What meiosis produces	C	B (four genetically different haploid cells)	Ch4 SLO 3	WRONG
14	Increasing order of organisation	A	A (cells → tissues → organs → systems)	Ch5 SLO 1	CORRECT
15	Group of similar cells with one function	B	B (a tissue)	Ch5 SLO 2	CORRECT
16	Which is a plant organ	B	B (leaf)	Ch5 SLO 8	CORRECT
17	Main carrier of hereditary information	C	C (DNA)	Ch6 SLO 8	CORRECT
18	Monomers of proteins	B	B (amino acids)	Ch6 SLO 3	CORRECT
19	Glucose is an example of a	B	A (monosaccharide)	Ch6 SLO 6	WRONG
20	Adenine pairs with	C	C (thymine)	Ch6 SLO 7	CORRECT
21	How RNA differs from DNA	B	B (single stranded)	Ch6 SLO 9	CORRECT
22	Building up complex molecules	B	B (anabolism)	Ch7 SLO 1	CORRECT
23	Enzymes are chemically	B	B (proteins)	Ch7 SLO 2	CORRECT
24	Where a competitive inhibitor binds	A	A (active site)	Ch7 SLO 5	CORRECT

The three misses, and what links them

All three are

definition-boundary

errors rather than gaps in understanding. In

Q9

she picked neurons instead of stem cells, though Q10 shows she knows what a neuron does, so the two ideas were most likely swapped under time pressure. In

Q13

she chose "two haploid cells", which is half right: meiosis does give haploid cells, but

four

of them, not two. In

Q19

she called glucose a disaccharide when it is the textbook example of a

monosaccharide

. Her MCQ score was re-read at 300 DPI because Q9 had been crossed out and rewritten; the final letter is a clear A.

Section B — Short Questions (3 × 3 = 9 Marks) — 9/9

Q	Topic	Awarded	Max	Examiner's note
2(i)	Taxonomic ranks; definition of species	3	3	All eight ranks in the correct order, Domain through to Species, and she added that Phylum is called division for plants and fungi, which is beyond what was asked. Species defined as organisms "capable of interbreeding or exchanging genes among themselves and producing fertile offspring". Full marks.
2(ii)	DNA structure, base pairing, function	3	3	"DNA is a polynucleotide as it is made up of many deoxyribonucleotides and is made of 2 long strands twisted into double helix. Each strand contains nucleotides made of sugar, phosphate group and nitrogenous base." Base pairing and function both correct. This is a stronger answer than the mark scheme required.
2(iii)	Factors influencing enzyme activity	3	3	Temperature, pH and substrate concentration all named, then temperature explained correctly through the optimum and on to denaturation, "changing the shape of its active site and reducing its activity". Full marks.

Section C — Long Questions (2 × 5 = 10 Marks) — 9/10

Q	Topic	Awarded	Max	Examiner's note
3(i)	Animal cell diagram; animal vs plant cell	5	5	(a) 3/3 — the paper asked for six labels and she gave ten : nucleus, nucleolus, nuclear membrane, cytoplasm, cell membrane, mitochondria, lysosome, Golgi apparatus, smooth endoplasmic reticulum and vacuole. Correctly drawn as an animal cell, with no cell wall and no chloroplast. (b) 2/2 — chloroplast present in plant but absent in animal, and cell wall present in plant but absent in animal. Both correct.
3(ii)	Stages of mitosis; mitosis vs meiosis	4	5	(a) 3/3 — all four stages in the right order, then Metaphase and Anaphase described accurately, including spindle fibres attaching at the centromere and chromatids being pulled to opposite poles. (b) 1/2 — the first difference (germ cells vs somatic cells) is correct, but the second is reversed : she wrote that in meiosis the cell divides only once and in mitosis it divides twice . It is the other way round. Meiosis has two divisions (meiosis I and II) producing four cells; mitosis has one division producing two.

What went well

A very strong paper.

Section B was flawless

and her DNA and enzyme answers carried more detail than the mark scheme asked for. The animal cell diagram was the best single piece of work on the paper, with ten correct labels against a requirement of six. Across both sections of written work she scored 18 of 19.

Revision priorities from this paper

• Meiosis: two divisions, four cells.

This cost her twice, once in MCQ 13 and once in 3(ii)(b), and both times the error was the *number* of divisions or cells rather than the concept. Fix it as a single fact: mitosis divides once giving 2 identical diploid cells; meiosis divides twice giving 4 different haploid cells.

• Stem cells vs neurons.

Chapter 3 defines stem cells as unspecialized cells that can become any type; a neuron is the opposite, a highly specialized one.

• Sugar classification.

Glucose is the standard

monosaccharide

; sucrose is the disaccharide; starch, glycogen and cellulose are polysaccharides.
