GRADE

Section Breakdown

Section A — MCQs (11/12)		91.7%
Section B — Short Questions (31.5/33)		95.5%
Section C — Long Questions (17.5/20)		87.5%
Overall (60.0/65)		92.3%

Strengths

- MCQs 11/12 — only the equilibrium-conditions item (Q12) slipped
- Stoichiometry all correct: Na_2CO_3 molar mass (106), empirical→molecular formula ($\text{C}_6\text{H}_{12}\text{O}_6$), three oxidation states, bond-energy ΔH (−103 kJ)
- Redox application perfect: oxidizing/reducing agents identified and $2\text{Fe} + 3\text{Cl}_2 \rightarrow 2\text{FeCl}_3$ balanced
- MgO electron-transfer, Al_2O_3 oxide layer, catalyst and equilibrium answers all full marks

Areas for Revision

- 3(ii)(b) not attempted (−2, biggest loss):** molecules in 3.6 g water skipped — the recurring “half a long question left blank” habit. Count every sub-part before moving on.
- Redox definitions (−0.5):** oxidizing agent takes electrons from the other substance (itself reduced); reducing agent gives electrons (itself oxidised).
- Electron affinity down a group (−0.5):** nuclear charge *increases* down a group; EA falls due to size/shielding.
- State symbols (−1):** when asked, add (s)/(l)/(g) to the balanced equation.

exam-14 (60.0/65, 92.3%) is Chemistry’s third full-syllabus Ch1–9 paper, closing a tight cluster with exam-12 (96.2%) and exam-13 (93.1%). It carries the subject’s first-ever MCQ error (Q12), ending the 13-exam perfect-MCQ streak. Chemistry subject average is $424.0/455 = 93.2\%$ across 7 papers. Both marks lost outside the MCQ — the skipped 3(ii)(b) and the missing state symbols — are simple recoverable drills.
