

+ Chemistry Ch 3.6: Cations and Anions

Chapter 3, Atomic Structure · kitab ke page 27 se 44

Neutral atom mein protons aur electrons barabar hote hain. Jab ye barabari **toot** jaye to atom par charge aa jata hai, aur usay **ion** kehte hain.

	Kya karta hai	Charge	Aam tor par
Cation	Electrons khota hai	Positive	Metals
Anion	Electrons leta hai	Negative	Non-metals

Kitab ki misalein

Cations: $\text{Na} \rightarrow \text{Na}^+$ (ek electron khoya) · $\text{Mg} \rightarrow \text{Mg}^{2+}$ (do khoeye)

Anions: $\text{O} \rightarrow \text{O}^{2-}$ (do liye) · $\text{F} \rightarrow \text{F}^-$ (ek liya)

Naam ulta mat karein

Yaad rakhne ka tareeqa: **cation** mein "t" ko **plus ka nishan** samjhein, to cation = positive.

Aur ek aur baat jo ulti lagti hai: electron **khone** se charge **positive** hota hai. Kyun? Kyunke electron negative tha. Negative nikal gaya, to positive baqi bacha.

Quiz

1. Define **cation** and **anion**, say which type of element usually forms each, and give two examples of each from your book.
2. Magnesium forms Mg^{2+} . Explain what happened to its electrons and why the charge is positive.
