

Is safhay ka faida bohat bara hai: **group number dekh kar ion ka charge bataya ja sakta hai**, bina kuch yaad kiye.

Group	Naam	Ion ka charge	Misal
1	Alkali metals	+1	Na^+ , K^+
2	Alkaline earth metals	+2	Mg^{2+} , Ca^{2+}
16	Chalcogens	-2	O^{2-} , S^{2-}
17	Halogens	-1	Cl^- , F^-
18	Noble gases	koi nahin	He, Ne, Ar

Usool, aur wajah

Har atom **noble gas jaisi** bairooni shell chahta hai, yani **8 electrons**.

Group 1 ke paas **ek zyada** hai, to wo **de** deta hai: charge **+1**.

Group 17 ke paas **ek kam** hai, to wo **le** leta hai: charge **-1**.

Aur noble gases ke paas **poore 8** hain, is liye wo **kuch nahin karte**: koi ion nahin.

Quiz

1. Name the families of groups 1, 2, 16, 17 and 18, and give the charge each one's ion carries.
2. Explain **why** a group 2 element forms a $2+$ ion while a group 17 element forms a $1-$ ion.
