

BIOLOGY : EXAM-18-CH1-7

Per-Exam Overview

Seemab · Class 9 · Federal Board (FBISE) · attempted 24 September 2026

48/50 TOTAL	96% PERCENTAGE	A GRADE	9/10 SECTION A	23.5/24 SECTION B	15.5/16 SECTION C	
5/5 CH1	5/5 CH2	5/5 CH3	9/9 CH4	5/6 CH5	6/6 CH6	13/14 CH7

WHAT HAPPENED

A 50-mark revision paper on Chapters 1 to 7, her whole biology course so far, sent as a straight revision exercise with no "ahead of class" content. She scored **48/50 (96%)**, her best Biology result since exam-13 (99.2%, 31 July) and a clear improvement on the last two papers (94.4% then 94.7%). Three of the four documented re-set weaknesses this paper deliberately re-served all landed correctly: ATP's high-energy bonds (MCQ 9), the photosynthesis equation coefficients (Q.8ii), and comparing the right two things in a meiosis difference table (Q.9i, confirmed a second way by MCQ 4 landing correctly too). She also caught her own "Mitosis" header slip on Q.9(i) mid-answer and struck it through for "Meiosis II" before giving a single difference, and the paper's tracked missing-conclusion habit did not appear at all. The one repeat miss is MCQ 5 (Table 5.2, lymphatic vs immune system), the exact same wrong choice she made on exam-16 Q12, now confirmed as a genuine two-time confusable pair rather than a one-off. The only other loss is half a mark on Q.7(ii) for never stating which respiration stage uses oxygen, and half a mark on Q.8(iii) for leaving NADP without its final H.

Where marks went	Marks	Kind
MCQ 5	1	Lymphatic system chosen instead of immune system (Table 5.2); repeat of exam-16 Q12
Q.7(ii)	0.5	All four respiration stages named in order, but never stated where oxygen is used
Q.8(iii)	0.5	Wrote NADP for the second energy-rich molecule, missing the final H of NADPH

Only 2 marks lost on the whole paper, and neither is a content misconception: one is a confusable pair repeating, one is an unanswered sub-part, one is an incomplete molecule name.

RE-TEST OUTCOMES

Re-test	Result
MCQ 5 : lymphatic vs immune system (missed exam-16 Q12)	NOT FIXED
MCQ 4 : meiosis I mechanism (also a re-test of the exam-17 Q.3(ii)(c) mix-up)	FIXED
MCQ 9 : ATP high-energy bonds (missed exam-16 Q17)	FIXED
Q.9(i) : right comparison in a difference table (missed exam-17 Q.3(ii)(c))	FIXED
Q.8(ii) : photosynthesis equation coefficients (missed exam-17 Q.2(i)(a))	FIXED

SUBJECT PERFORMANCE CARD

Strengths on this paper

- Meiosis (Q.9): flawless 8/8, all four differences genuinely two-sided
- Photosynthesis figure labels (Q.8i): all four correct
- Every difference-table pair on the paper correctly filled both sides (Q.3, Q.5, Q.9i)
- Four of five targeted re-tests fixed this attempt, incl. MCQ 4
- Caught and corrected her own "Mitosis" header slip on Q.9(i) before answering
- Missing-conclusion habit, a tracked weakness, did not appear anywhere on this paper
- MCQ 8's flagged risk (pentose sugar vs nitrogen base) did not materialise

Areas needing work

- Lymphatic vs immune system, Table 5.2 (MCQ 5): wrong twice now
- Answer every sub-part of a multi-part question, not just the list (Q.7ii)
- Add the final H to NADPH (Q.8iii)

COMPARISON : PREVIOUS BIOLOGY ATTEMPT

Exam	Date	Score	%	MCQ
exam-17-ch1-7 (Version B)	17 Sep 2026	36/38	94.7%	10/10
exam-18-ch1-7	24 Sep 2026	48/50	96%	9/10

A genuine step up in percentage (94.7% to 96%) even though the MCQ record slipped one mark, because the one MCQ miss is the same repeat confusable pair, not a new gap. Section B and C both stayed very strong.

Biology now stands at **91.9%** across **15 attempts** (790.45/860) after this attempt. Lifetime Biology MCQ record: **196/208 (94.2%)**.
