

CHEMISTRY — EXAM-23-CH10-REV4-6-8-9

SINGLE ATTEMPT

Per-Exam Overview · Version B

Seemab · Class 9 · Federal Board (FBISE) · attempted 21 September 2026

CORRECTED 2026-09-21 after a blind deep check: Q.2(ii) was misread as "H2O" (it is "H3O", a clear subscript 3), and the Q.9 diagrams were misread as level (products are genuinely drawn lower than reactants). Score corrected from 35.5 to 36/50.

WHAT HAPPENED

Her first-ever paper on Chapter 10 content, built as 70% brand-new material plus 30% deliberately re-served weak spots from earlier papers. **All three targeted MCQ re-tests landed** (catalyst list, s-block group/period, dynamic equilibrium rates), and **state symbols are finally consistent** across every equation she wrote (Q4 and Q6) — an instruction she had never fully followed before. The drop to 72% (her first Chemistry score under 80%) comes almost entirely from brand-new-content misses: two ionization equations written backwards (Q.3), naming the acidic product H3O+ rather than the proton donor HCl as the Bronsted acid (Q.2ii), forgetting oxygen is diatomic (O2) in both burning equations (Q.8i), and giving a formula where an English name was asked (Q.8, Q.6ii). The missing-conclusion-sentence habit shows up once, localized to the Q.7 calculation, not across all of Section B.

Where marks went	Marks	Kind
MCQ 1	1	Called water the Bronsted base (should be acid) — her only water-as-base slip on the paper
Q.2(ii)	1	Labelled the product H3O+ as the acid instead of the proton donor HCl
Q.3(i)/(ii)/(iii)	2.5	Two ionization equations written backwards; the third has right direction/arrow but wrong ion formulas
Q.4(ii)	1	Na2CO3 + HCl equation not balanced (missing "2" before NaCl)
Q.6(ii)	0.5	Correct equation, gas never named in words separately
Q.7(ii)	0.5	Correct number, no unit on the mass answer
Q.8(i)	3	Both burning equations missing O2; neither oxide given an English name
Q.8(ii)	1.5	All three equations correct, English name never given (formula repeated instead)
Q.9(ii)/(iii)	3	No x-axis label, Ea labelled but not as an arrow to the peak, ΔH never labelled, no catalyst/ΔH sentence

None of these 14 lost marks are re-tested weaknesses returning — the paper's explicit re-tests (3 MCQs + state symbols + the diagram's Ea/catalysed-curve pair) all improved or fixed. The loss is concentrated in first-attempt content on Ch 10.5 and genuine process gaps (ionization direction, naming vs formula, missing ΔH).

RE-TEST OUTCOMES

Re-test	Result
MCQ 8 — catalyst list, nickel for margarine	FIXED
MCQ 9 — configuration 2,8,2 → Group 2, Period 3	FIXED
MCQ 10 — dynamic equilibrium, forward rate = reverse rate	FIXED
Section B Q4 & Q6 — state symbols	FIXED
Section B Q7 — full concluding sentence in the calculation	NOT FIXED
Section C Q9 — Ea label + catalysed curve + ΔH unchanged statement	HALF FIXED

SUBJECT PERFORMANCE CARD

Strengths on this paper

- State symbols: consistent and correct everywhere (Q4, Q6)
- All 3 targeted MCQ re-tests fixed
- Reversible vs single arrow (Q3iii/iv) understood
- Alkali-vs-base reasoning (Q5) and base properties (Q6i): clean full marks
- Energy diagram: products correctly below reactants, catalysed curve present, Ea labelled

Areas needing work

- Ionization direction: acid → ions, not ions → acid (Q3i/ii)
- Naming the correct species as the Bronsted acid (proton donor, not the product) (Q2ii)
- Naming compounds in words, not just formulas (Q8, Q6ii)
- Oxygen is diatomic: O2, not O (Q8i)
- ΔH must be labelled on every energy diagram (Q9ii/iii)

COMPARISON — PREVIOUS CHEMISTRY ATTEMPT

Exam	Date	Score	%	MCQ
exam-22-ch1-9	14 Sep 2026	42/50	84.0%	9/10
exam-23-ch10-rev4-6-8-9	21 Sep 2026	36/50	72%	9/10

MCQ performance held exactly steady at 9/10. The percentage drop is explained by the paper's shape: this is the first-ever assessment of Chapter 10's second half (oxides/hydroxides/neutralization) at full 8-mark depth, not a re-test of anything she was previously strong on. Her revision block (76.7%) actually out-performed the new-chapter block (70.0%).

Chemistry now stands at **91.2%** across **16 exams** (858.0/941) after this attempt, still comfortably an A-average subject. Lifetime Chemistry MCQ record: **240/266 (90.2%)**.
