TOTAL

85.5%

PERCENTAGE

A

GRADE

7/10

SECTION A

10.5/12

SECTION B

15/16

SECTION C

WHAT HAPPENED

She sat Version B, the 38-mark paper with three short questions, the same day it was sent. Her written work scored **25.5 out of 28** and the long questions lost only one mark. The lamp-post question, eight marks across four parts, was perfect, and every part ended with a written conclusion.

Seven of the ten re-tested past mistakes came back fixed: the sum-of-cubes signs, absolute value, the minus on an inequality bound, naming the additive property, verifying both roots, the collinear conclusion, and the $\pm$ on a square root. The two that did not are the ordered-pair question ($a = 9$ again) and naming the log laws.

Where marks went	Marks	Kind
Q3 $\log_3(1/27)$	1	Skipped: her MCQ numbering slipped
Q7 inequality	1	Working right ($-1 \leq x \leq 4$), wrong letter copied
Q9 ordered pairs	1	Gave the element (9), not a (5): repeat of exam-16
2(i)(a) $\log 72$	1	Right value, laws not named
2(i)(b) characteristic	0.5	Reached 10^{-2} , never wrote -2
3(i)(a) square root	1	Correct division, final answer written with an extra square

Only one of the 5.5 lost marks is a real maths gap (the ordered pair). The rest are a skipped question, a copied letter, and three last lines left unfinished. She also wrote that she used a calculator for Q1, which the paper does not allow.

POSITION IN THE SUBJECT

Mathematics now stands at **93.1%** across **14 attempts** (767.0 / 824), second behind Physics. Her lifetime Maths MCQ record is **173/188 (92.0%)**. This is her fourth Maths paper in a row at Grade A.
