WHAT HAPPENED

Her joint-best Physics paper of the year, and the first one built entirely from her own Aasan Notes. Unit 7 Parts 7A and 7B had not been taught in class at all, and she still took 25.5 of the 27 marks on that material. MCQs 10 out of 10, with every letter numbered in her own hand and no reading ambiguity anywhere. The whole revision half, Unit 6 efficiency and the three revision MCQs, came back perfect at 11 out of 11.

All six quiz questions from her Part 7A and Part 7B notes were on this paper, worth 13 of the 27 new marks. She banked every one of them. The measuring cylinder question, the one her audio lesson walks through, was flawless: the subtraction named before it was done, 40 g, then 0.8 g/mL, then 800 kg/m3, closing with the full sentence the paper asked for.

WHERE MARKS WENT

Item	Marks	What happened
Q.4(i), arrangement of a gas	0.5	Wrote "flowing", which describes movement and not arrangement, and does not separate a gas from a liquid. The word she needed, random, was one row below in her own table.
Q.5(B)(vi), naming the metal	1.0	Wrote tungsten. The question said to use Table 7.1, which lists gold at 19300 and does not contain tungsten. She had the number exactly right and then answered from memory.
Neither loss is a gap in her physics. On Q.5(vi) she calculated 19300 kg/m3 correctly and then named tungsten, which really does sit at about 19250 kg/m3 and is the classic material for faking gold. Her reasoning was sound; she simply answered from memory instead of opening Table 7.1, which the question told her to use and which lists gold at 19300 and no tungsten at all. On Q.4(i) she put a movement word in an arrangement box. Both are the same habit seen from two sides: going from memory when the book has the answer in front of her.		
Five tracked weaknesses were deliberately re-served on this paper and all five came back correct: the half-mass double-speed kinetic energy trap from her OPF First Term paper (she struck out a first letter and settled on the right one herself), the dam reservoir energy question she previously answered as electrical, treating a weight in newtons as a mass, writing the concluding sentence, and carrying units. Zero unit deductions on the whole paper. The missing-conclusion habit had been appearing across six papers; here she wrote it on both questions that asked for it and labelled it "full sentence" each time.		

POSITION IN THE SUBJECT

Physics now stands at 93.8% across 15 exams (793.5 / 846) and keeps the top spot among all six subjects. Lifetime Physics MCQ record 195/206 (94.7%), lifted by a clean 10 out of 10 here.
