

Chemistry | Chapters 1 to 9 (Comprehensive)

Revision Test 2026 | SSC-I (9th Grade) | Version 1 | 43-mark no-choice paper

Candidate: Seemab | Date: 21 August 2026 | Total Marks: 43 | Syllabus: Nature of Chemistry, Matter, Atomic Structure, Periodic Table, Chemical Bonding, Stoichiometry, Electrochemistry, Energetics, Chemical Equilibrium

35 / 43 TOTAL SCORE <i>second 43-mark paper</i>	81.4% PERCENTAGE	A GRADE	17 / 24 MCQ 70.8%
--	----------------------------	-------------------	--------------------------------

Section Breakdown

Section	Performance	Score
Section A (MCQs)	Her weakest MCQ section to date. Four of the seven losses are the entire Chapter 5 bonding block	17/24 (70.8%)
Section B (Short Ans.)	Flawless. CaF_2 dot-and-cross, lithium relative atomic mass, beryllium group/period/ion	9/9 (100%)
Section C (Long Ans.)	Both long numericals fully correct; the only loss is the missing state symbols	9/10 (90%)

Per-Question Marks

Q	Topic	Awarded	Max	Note
A.1-24	All twenty-four multiple choice	17	24	Q6 shell energy, Q13 metallic bond, Q14 electropositive, Q15 melting points, Q16 noble gas config, Q20 $\text{Ca}(\text{NO}_3)_2$, Q24 activation energy. All seven confirmed on-SLO
2(i)	CaF_2 dot-and-cross; name the bond	3	3	Correct one-to-two transfer, Ca^{2+} and two F^- . Ionic bond defined correctly
2(ii)	Relative atomic mass of lithium; p/n/e	3	3	6.925 with the formula shown; 3, 3 and 4 for ^7Li . Full marks
2(iii)	Beryllium configuration, group, period, ion	3	3	$1s^2 2s^2$, both reasons correct, and the group-to-ion-charge link explained
3(i)	Empirical/molecular formula; balanced equation	4	5	Calculation perfect through to K_2CO_3 and the multiplier. Equation balanced correctly but no state symbols , which the question required
3(ii)	$\text{Mg}(\text{NO}_3)_2$ molar mass, moles, formula units, oxidation number	5	5	148 g/mol, 0.15 mol, 9.033×10^{22} , and +2 with the correct rule. Full marks

The finding that matters. Chapter 5 (Chemical Bonding) accounts for four of her seven MCQ losses, while every other chapter held up: Ch1 1/1, Ch2 3/3, Ch3 3/4, Ch4 4/4, Ch6 4/5, Ch7 2/2. This is a single-chapter gap, not a general decline, which makes it unusually easy to fix. The specific confusions are metallic versus ionic bonding, the meaning of electropositive, the melting points of ionic compounds, and the noble gas configuration that atoms bond to reach.

Knew it, still lost it. Two marks were lost on things she demonstrably knows. In MCQ 13 she gave the ionic bond definition as the answer for a **metallic** bond, then wrote that same ionic definition correctly in Section B. In Q.3(i)(c) she balanced the equation perfectly and omitted the state symbols, having answered MCQ 19 on the meaning of (aq) correctly. Both are instruction-reading slips rather than knowledge gaps, and the second is the same slip that cost her a mark on Mathematics exam-15.

Syllabus audit. All 24 MCQs were written against the Student Learning Outcomes printed in Seemab's own textbook. Because the Chemistry chapter scans carry no text layer, each chapter's SLO pages were rendered as images and read directly during the build. After marking, every one of the seven questions she got wrong was re-checked against the printed option order and its stated SLO. **All seven are sound and no question needed voiding**, unlike Physics exam-13 and Chemistry exam-18. Her MCQ score of 17/24 also sits well below her baseline, so all 24 answers were re-read from the scan at 400 DPI and the key was re-extracted independently before any mark was recorded.
