SECTION B

9/10

SECTION C

WHAT HAPPENED

Twenty of twenty-four MCQs, eight of nine in Section B and nine of ten in Section C. **The single best answer on the paper was the hardest one:** the five-mark coordinate-geometry question, where she found all three side lengths, proved the right angle by the converse of Pythagoras, located the mid-point of the hypotenuse and showed it was equidistant from all three vertices, at 5 units each. That is a three-formula chain with no slip anywhere.

The six marks she lost, and what kind of loss each was

Where	Marks	Kind of loss
Q11, MCQ	1	Recall. Sum-of-cubes sign pattern, missed for the second paper running.
Q.2(ii)	1	Instruction. Right value, 1.6811, but no law named though the question demanded it.
Q.3(i)(b)	1	Instruction. Factorized to $(7p - 6q)^2$ and stopped without writing the square root.
Q18, MCQ	1	Recall. Named the transitive property where the additive property was shown.
Q22, MCQ	1	Instruction. Solved for the element rather than for a .
Q5, MCQ	1	Content. Babylonian sexagesimal system, base 60.

Only one of the six is a genuine content gap. Two are sign or name recall, three are answering less than the question asked. That is why this paper is better than 86% suggests, and also why the fix is cheap.

What went right

Section B 2(i) and 2(iii) were flawless, including verifying **both** roots of $|2z - 3| = 9$ — the exact kind of extra step she skipped on the log question one line above. Section C 3(i)(a) and (c) were both fully correct, and (c) was the longest single piece of algebra on the paper, four factorizations followed by an inversion and three cancellations down to $x/(x - 8)$.

POSITION IN THE SUBJECT

Mathematics now stands at **93.9%** across **12 attempts** (691.0 / 736), a shade behind Chemistry for the top subject spot. Her lifetime Maths MCQ record is **160/168 (95.2%)**. This is her first Maths paper below 90% since 25 May, and it interrupts a run of nine consecutive A+ grades.
