

Physics | Units 1 to 6 and Unit 9 (Comprehensive)

Revision Test 2026 | SSC-I (9th Grade) | Version 1 | 43-mark no-choice paper

Candidate: Seemab | Date: 21 August 2026 | Total Marks: 43 | Syllabus: Physical Quantities & Measurement, Kinematics, Dynamics-I, Dynamics-II, Pressure & Deformation, Work & Energy (till Ex. 6.4), Nature of Science & Physics

37 / 43 TOTAL SCORE <i>second 43-mark paper</i>	86.0% PERCENTAGE	A GRADE	20 / 24 MCQ <i>83.3%</i>
--	----------------------------	-------------------	---------------------------------------

Section Breakdown

Section	Performance	Score
Section A (MCQs)	Four losses spread across four different units, with no single weak chapter	20/24 (83.3%)
Section B (Short Ans.)	Flawless, and Q.2(ii)(b) was the best-reasoned answer on either paper this sitting	9/9 (100%)
Section C (Long Ans.)	The energy question is perfect; the graph question lost 2 marks to one misconception	8/10 (80%)

Per-Question Marks

Q	Topic	Awarded	Max	Note
A.1-24	All twenty-four multiple choice	20	24	Q5 area under a speed-time graph, Q12 instrument for mass, Q21 non-renewable resource, Q23 perpetual motion. All four confirmed on-SLO
2(i)	Vernier caliper least count and reading	3	3	0.002 cm, then $6.7 + 25(0.002) = 6.75$ cm. Method laid out properly
2(ii)	Centre of mass versus centre of gravity	3	3	Clean two-column comparison, and the non-uniform-field condition stated more precisely than the mark scheme asked
2(iii)	Barometer with a liquid other than mercury	3	3	$\rho_1 h_1 = \rho_2 h_2$ giving 304 cm, plus $h \propto 1/\rho$. Full marks
3(i)	Speed-time graph: stages, acceleration, distance	3	5	Stages described correctly and the 420 m distance exactly right, but she used the triangle area (70) as the acceleration instead of the gradient (1.4 m/s^2)
3(ii)	Energy resources, hydroelectric, work and power	5	5	Both definitions with two examples each, both hydroelectric points, and 63,000 J then 700 W with full working. Full marks

The finding that matters: one idea, three marks. Three answers on this paper point at the same gap. In MCQ 5 she said the area under a speed-time graph gives the **acceleration**. In Q.3(i)(b) she calculated the triangle's **area** and wrote it down as an acceleration in m/s^2 . Then in Q.3(i)(c) she used an area to find the **distance**, correctly and completely. She is perfectly comfortable computing areas; what she has not separated is **gradient** from **area**. Fixing that single sentence, the slope of a speed-time graph is the acceleration and the area underneath it is the distance, is worth 3 marks here and nothing else on the paper comes close.

Knew it, still lost it. In MCQ 21 she picked geothermal as the non-renewable resource, yet in Section C she defined both terms correctly and named coal and natural gas herself as the non-renewables. That is a slip on the multiple choice rather than a gap.

Syllabus audit. All 24 MCQs were written against the Student Learning Outcomes printed in Seemab's own textbook, with the source section and SLO code recorded beside every question in the answer key. After marking, each of the four she got wrong was re-checked against the printed option order and its stated SLO. **All four are sound and no question needed voiding.** Three of her answers (Q5, Q9, Q10) carry a scribbled-out first attempt, so every answer was re-read from the scan at 400 DPI and the key was re-extracted independently before any mark was recorded.
