

Seemab — Class 9 Performance Overview

Federal Board (FBISE) | All Subjects | Version 52

Generated 21 August 2026 | Chemistry exam-19 (35/43, A) and Physics exam-14 (37/43, A)

93.3%OVERALL
2642.95 / 2834**46**ATTEMPTS
across 4 subjects**572/600**MCQ RECORD
95.3% lifetime**5**PERFECT PAPERS
100% scores**Two Grade A papers, and the first real dip in months**

Chemistry exam-19 (35/43, 81.4%) and Physics exam-14 (37/43, 86.0%) are her first pair without an A+ since June. Both written sections held up well: Section B was **flawless on both papers**, 9/9 each, and three of the four long questions were fully correct. The whole of the drop sits in Section A, where she scored 17/24 and 20/24 against a lifetime MCQ record near 97%.

Part of that drop is the paper, not the student

These were the first two papers to carry **24 MCQs instead of 12**. Doubling the multiple choice doubles the breadth sampled, and it reached into corners the shorter papers never touched: the metallic bond definition had not been examined since exam-02, electropositive character not since exam-12, and the noble-gas-configuration rule not since exam-02. Her score across those 48 questions is not directly comparable to her record on 12-question papers, which sampled the same well-worn topics repeatedly. This is the coverage discipline working as intended, and it has surfaced two genuine gaps that the old format was hiding.

Gap one: Chapter 5, chemical bonding

Four of her seven Chemistry MCQ losses are the **entire Chapter 5 block**, questions 13 to 16. Every other chapter held: Ch1 1/1, Ch2 3/3, Ch3 3/4, Ch4 4/4, Ch6 4/5, Ch7 2/2. A single-chapter gap is the easiest kind to close. She needs metallic versus ionic bonding, what electropositive means, that ionic compounds melt higher, and that atoms bond to reach a noble gas configuration.

Gap two: gradient versus area, worth 3 marks on one paper

Three Physics answers point at one idea. In MCQ 5 she said the area under a speed-time graph gives the acceleration. In Q.3(i)(b) she computed the triangle's area, 70, and wrote it down as an acceleration in m/s^2 . Then in Q.3(i)(c) she used an area to find the distance, correctly, arriving at exactly 420 m. She can compute areas perfectly well; she has not separated **slope = acceleration** from **area = distance**. That one sentence is worth 3 marks.

The syllabus rule held again

All 48 MCQs across the two papers were written against the Student Learning Outcomes in her own textbooks, with the source section and SLO printed beside every answer in the keys. After marking, all eleven questions she got wrong were re-checked against the printed option order and their stated outcomes. **Every one is sound and nothing needed voiding**, the third consecutive sitting where that is true. Her MCQ scores also came in below baseline, so all 48 answers were re-read from the scan at 400 DPI and both keys were re-extracted independently before any mark was recorded.

Two marks lost on things she knows

Worth separating from the genuine gaps. In Chemistry she gave the ionic bond definition as her answer for a **metallic** bond, then wrote that same definition correctly in Section B. She balanced the K_2CO_3 equation perfectly and omitted the state symbols the question asked for, having answered the (aq) question correctly moments earlier. In Physics she picked geothermal as non-renewable, then defined the term correctly and named coal herself in Section C. That equation slip is the same one that cost her a mark on Mathematics exam-15: **read the whole instruction, then answer all of it**.

exam-14-ch1-7	19 Aug 2026	39/43	90.7%	A+	

MCQ: 138/144 (95.8%), 5 errors. Unchanged this version; meiosis remains her standing revision item.

Movement this version. Mathematics takes the top spot at 94.4% for the first time since June, not by improving but because Chemistry sat a paper and Maths did not. Chemistry falls from 94.7% to 93.9%, Physics from 93.8% to 93.3%, Biology holds at 91.4%. Overall drops from 93.6% to **93.3% across 46 attempts**, and the lifetime MCQ record moves from 96.9% to **95.3%**. No items remain open on any paper.

What to do before the next paper. Two things, in this order. **Chapter 5 bonding** for Chemistry, which is one chapter and accounts for over half her Chemistry MCQ losses. Then **slope versus area on a speed-time graph** for Physics, which is one sentence and was worth 3 marks. Both are narrow and both are fixable in a single sitting each.
