PERFECT PAPERS
100% scores

Biology back to an A+, and a Maths paper that is better than its number

Biology exam-15 came in at **39/43 (90.7%, A+)** and Mathematics exam-16 at **37/43 (86.0%, A)**. She sat both on the same day she received them. The Biology paper is her strongest written performance of the year:

Section C was perfect, 10/10, and Section B lost a single mark. The Maths paper looks like a dip and partly is one, but four of its six lost marks are recall or instruction-reading rather than method, and the hardest question on the paper was answered perfectly.

The meiosis gap is closed

Meiosis dividing twice and yielding four haploid cells cost her marks **twice** on Biology exam-14, in MCQ 13 and again in Section C. It was deliberately re-tested on this paper from two different angles: an MCQ and a five-mark question that made her run a 20-chromosome cell through both divisions. **She got both, in full.** That item comes off the revision list.

The sum-of-cubes sign did not close

The other deliberate re-test went the other way. On Maths exam-15 she picked the $a^3 - b^3$ form as the factorization of $a^3 + b^3$. On exam-16, asked to factorize $27x^3 + 64$, she chose the same wrong sign pattern again. Note that on exam-15 she then *applied* the identity correctly inside Section C, so this is recall of the signs rather than a gap in understanding. The rule to memorise is short: **the bracket sign matches the question, and the middle sign inside the trinomial is the opposite of it.**

Reading the whole instruction, now a three-paper pattern

On Maths exam-15 she lost a mark by not naming the properties of inequalities when asked. On Chemistry exam-19 she balanced an equation perfectly and omitted the state symbols the question required. On this Maths paper it happened twice more: she evaluated $\log 48$ to exactly 1.6811 without naming a single law, and she factorized $49p^2 - 84pq + 36q^2$ into $(7p - 6q)^2$ and stopped, never writing the square root the question asked for. **Every one of those marks was lost after the hard work was already done.** This is now the single highest-value habit available to her: underline the verbs in a question before starting, and tick them off before moving on.

The syllabus rule held for a fourth sitting, and caught a bad question

All 48 MCQs across the two papers were written against the Student Learning Outcomes in her own textbooks, with the source section and SLO printed beside every answer in the keys. After marking, all seven wrong answers were re-checked against the printed option order and their outcomes; every one is sound.

The audit did find one defective **written** question. Biology Q.2(ii) asked for **three** advantages an animal cell gains from lacking a cell wall, "as listed in your textbook" — but the comparison table in Chapter 3 clearly supplies only **two**. **The marks were restored in full.** Her score would otherwise have been 38/43. The lesson for the next build is narrow and worth keeping: before asking for *N* of something, count how many the book actually gives.

Marking method

Every mark was set twice. A first pass was followed by a fully independent re-verification that re-read every page of both scans at 400 DPI, re-extracted both answer keys from the published PDFs rather than trusting a

stored list, and rebuilt the MCQ letter lists from scratch before comparing. The two passes agreed exactly on all 48 MCQ readings and on both keys, and disagreed on two written marks, both of which were resolved in her favour after checking the source pages in her textbooks. One MCQ letter (Maths Q20) is genuinely ambiguous in the scan and was credited; if Seemab says she meant something else, that paper drops to 36/43.
