A 60-MCQ paper, and what it says

Chemistry exam-20 came in at **59/71 (83.1%, A)**. It is a new shape of paper: sixty multiple-choice questions carrying 60 of the 71 marks, then two short questions and one long one. She sat it the day she received it. Her written work was the strongest part — **6/6 in Section B and 4/5 in Section C** — and the single mark she lost there was for stopping one instruction short, not for anything she could not do.

Chapter 5 bonding is closed

On exam-19, four of her seven MCQ losses were the entire Chapter 5 bonding block, and it was flagged as a single-chapter gap. On this paper Chapter 5 came back at **9 out of 10**, across ten questions that reached lone pairs, electron-deficient BF_3 , van der Waals forces in graphite, the duplet rule and metallic malleability. That item comes off the list.

What replaces it is smaller

Two things, both narrow. She is mixing up the **group** rule and the **period** rule: given $1s^2 2s^2 2p^2$ she counted four valence electrons correctly and answered Group 4 instead of adding 10 for the p block, then separately said the period number equals the valence-electron count. And she has the **oxidizing and reducing agent inverted**: asked for the reducing agent in $\text{CO}_2 + 2\text{Mg} \rightarrow 2\text{MgO} + \text{C}$ she named CO_2 . The rule is one line — the species that is oxidized is the reducing agent.

Answering less than the question asked, now five papers running

Section C(e) asked her to rewrite her balanced equation with state symbols. She balanced it perfectly and stopped. That is the same mark lost the same way on Maths exam-15, Chemistry exam-19, and twice on Maths exam-16. **Every one of these was lost after the hard work was already done**, and it remains the single highest-value habit available to her.

Why the percentage is not comparable to her older papers

On the 65-mark papers that built most of this record, Sections B and C carried 53 of the 65 marks and she has been near-perfect in them all year. On this paper Section A alone carries 60 of 71. Doubling the MCQ count again — from 12, to 24 on exam-19, to 60 here — reaches sub-topics that shorter papers never sampled, and nine of her eleven losses are on material examined once before or never. **The drop is substantially structural; do not report it as decline without saying so.**

Marking method

Every mark was set twice. The first pass re-read all sixty letters from the scan at 400 DPI and re-extracted the answer key from the published PDF rather than a stored list. The second pass went further and **re-derived all sixty correct answers from the printed exam paper itself**, reading the options off the page and deciding each independently before comparing — which found **zero key errors across all sixty questions**. That check matters because an error on one of the forty-nine she got right would have cost a mark nobody was looking for. A guard against a systematic numbering slip was also run: her list scores 49 aligned and only 10 to 14 under any shift. All eleven wrong answers sit on stated Student Learning Outcomes and none needed voiding.

One read remains genuinely open. On the ammonia dot-and-cross the lone pair on nitrogen cannot be separated from the adjacent bonding pair because the ruled lines cross that region; the mark was awarded on her correct written count. Read the other way the paper is 58/71.

A caution on the Chapter 8 zero

Chapter 8 was worth two marks of sixty and she got neither. That is not a chapter-level gap. Energetics is a seven-page chapter examined on eight previous papers, and the only angles left unused by this one were two fine-grained clauses. Both marks stand, but two questions on the most obscure sentences in a nearly exhausted chapter measure very little.

MCQ: 197/216 (91.2%), 19 errors. Slips to third on this version after two 43- and 71-mark papers in two days. Chapter 5 bonding, which cost four marks on exam-19, was almost clean here at 9/10.
