

CUMULATIVE PROGRESS OVERVIEW

• VERSION 58

Seemab, Class 9 Performance Overview

Federal / Punjab Boards | All Subjects | Version 58
Generated 13 September 2026 | Islamiat exam-02 (30/46, first attempt)

92.4% OVERALL 2937.45 / 3179	53 ATTEMPTS across 5 subjects	739/808 MCQ RECORD 91.5% lifetime	5 PERFECT PAPERS 100% scores
------------------------------------	-------------------------------------	---	------------------------------------

A fifth subject begins: Islamiat

Seemab sat her first-ever Islamiat exam on 13 September, exam-02 covering Bab 1, 2, 3, 4, 6 and 7. She scored 30/46 (65.2%, Grade B). This is a new baseline, not a dip: it is her first graded exposure to Urdu-medium recall of names, dates, distances and hadith counts, and it sits outside the four subjects (Maths, Chemistry, Physics, Biology) that make up her 90%+ norm and her established MCQ-coaching history. It is not directly comparable to those subjects' scores, and is reported separately below rather than folded into the cross-subject average's narrative.

The written sections already work. Q.2(ii), on Hazrat Umm Sulaim's services in the battles, scored a clean 4/4 with all four required points named. Q.3, the 8-mark essay on the compilation of the Quran, scored 7/8 with all three required eras (the Prophet's ﷺ time, Abu Bakr's, Usman's) present in the right order and the right names, losing only the opening citation of Surah al-Hijr, ayah 9. When she knows the structure of an answer, she builds it correctly on the first attempt in a subject she has never been examined in before.

Where it fell away: the Bab 3 Seerat cluster. Eight of eleven MCQs from Q.10 to Q.20 were wrong: the distance to Wadi Hunain, the tribes settled there, who rallied the scattered fighters, why Kaab bin Malik's repentance was accepted, the year of Hajjat-ul-Wida, and where Hazrat Ali's status was declared. These are dense, number-and-name-heavy facts from Fatah Makkah, Ghazwa Hunain, Tabuk and Hajjat-ul-Wida, and they are the clear priority for her next Islamiat revision session. Two further losses (Q.23 Hasad vs Rashk, Q.25 Hazrat Shifa vs Hazrat Umm Atiya) are confusable-pairs mix-ups, the same pattern already tracked in her other subjects, now appearing on brand-new content.

A first for the marking process too. This is the first time Urdu handwriting has been marked in this project. Every MCQ letter was confirmed from a magnified crop of the original CamScanner scan. Two answers (Q.2(i) and Q.3) were fast, joined cursive; both were marked from content that was independently confirmed on repeated close zoom, with an explicit note in the full report on the small number of connecting words that could not be nailed down to a word-perfect transcript.

The multiple-choice problem is fixed

Physics exam-15 came in at 45/46 (97.8%), her strongest paper of the year. Three weeks ago multiple choice was the clear weak point of her work. The trajectory since:

Paper	Date	MCQ score
Mathematics exam-17	7 Sep	6/10 (60%)
Chemistry exam-21	9 Sep	25/30 (83%)
Physics exam-15	10 Sep	29/30 (97%)

She was asked to change one thing, and she changed it. The diagnosis on 8 September was that her multiple choice failed not from missing knowledge but from answering quickly with nothing written down. The instruction was to do rough working on paper for every MCQ. This attempt is the first where she has written out working and a stated reason for her multiple-choice answers rather than only letters: why the leading zeros in 0.02080 do not count, why a body is at rest rather than accelerating, why the odd option is a disadvantage rather than an advantage. The score moved with the behaviour.

All four repeat errors corrected in one paper. Four questions were set deliberately because they are the exact items she had got wrong before: the gradient of a speed-time graph (wrong on exam-12 and again on exam-14), the area under one (her longest-standing physics error), the SI unit of pressure, and renewable versus non-renewable resources. She answered all four correctly, three with working shown. Gradient against area is the pair she had never separated; she got both directions right in the same paper.

The single lost mark was not knowledge. Question 3 asked which instrument measures weight directly. She wrote A, physical balance. Her own reason underneath reads: "because spring balance is measuring force, measuring cylinder is used to measure volume and vernier calipers are used to measure small lengths." She reasoned to B and recorded A. The habit still to build is to check the letter written against the reason argued, which would have made this a perfect paper.

Mathematics exam-17: a diagnosis we got wrong, and the evidence that corrected it

When only her MCQ page had arrived, the reading was that she has a weakness with negative numbers: three of her four wrong answers involved a sign. That diagnosis was recorded and it was wrong.

Her written sections disprove it. She solves a compound inequality to $-3 < x \leq 4$ with the negative bound correct. She evaluates $(-3)^2$ and $(-4)^2$ correctly inside a distance calculation, and handles $7 - (-3) = 10$. She computes $\log 0.9 = -0.0458$ and accepts $x = -7$ as a valid root. And on the right-angled-triangle question she wrote $(-15)^2$, caught the error herself, struck it out, and corrected it to $(-5)^2 = 25$.

She is not weak at negative numbers. She is weak at answering quickly with nothing written down. Every sign error she made was on a multiple-choice question answered mentally; she made none in the sections where she showed her steps, and she caught and fixed one unprompted. The remedy is a method change, not topic revision: she should do rough working

on paper for MCQs. That instruction has been passed on with the Chemistry paper sent this week.

One genuine knowledge gap. Not every MCQ error was a speed slip. Asked for $\sqrt{48} + \sqrt{27}$ she answered 75, having added the numbers underneath two different radical signs. That is a rule she does not have: each radical must be simplified first ($\sqrt{48} = 4\sqrt{3}$, $\sqrt{27} = 3\sqrt{3}$) before like terms are added, giving $7\sqrt{3}$. This is the product rule for radicals, Unit 1 §1.4.3, and it belongs on the revision list in its own right rather than being folded in with the sign slips.

A second, narrower one: she read $|-8|$ as -8 . Worth noting that across all sixteen previous maths papers she had only ever been asked to solve absolute-value equations, never to evaluate one, so this was a form she had genuinely never met rather than something forgotten.

Answering less than the question asked: the six-paper streak, now broken

Version 54 recorded this across five papers. Exam-17 adds three more instances in a single paper, and it is now unambiguously her most expensive habit.

Question	What it asked for	What she wrote	Lost
2(v)(a)	Solve and verify both solutions	Both roots, correct	0.5
3(i)(b)	The square root	$3x^2 - 2x + 1$, without the $\pm$	0.5
3(ii)(b)	Show P, Q, R are collinear	$10 = 10$, no conclusion	0.5
3(ii)(c)	Midpoint, and show it is Q	(4, 6), never linked to Q	1.0

Together with exam-10 (quadrant not stated), exam-13 (quadrilateral not classified), Maths exam-15, Chemistry exam-19, twice on Maths exam-16, and Chemistry exam-20. Chemistry exam-21, two days later, lost nothing to this: the streak is broken.

2.5 marks on this paper alone, and every one of them lost after the mathematics was already finished correctly. The trigger words are "show that", "hence", "verify" and "prove": each demands a written conclusion even when the working already proves it. Fixing only this habit would have turned 43.5 into 46, without her learning any new mathematics.

One fair point she raised herself, which checks out: her textbook does not verify absolute-value equations. Unit 5 Examples 7, 9 and 10 all stop at the solution set. The book's "check by substitution" step belongs to radical equations, where squaring can create extraneous roots. Her class method was correct; the question simply asked for something extra, and she had done exactly that when asked on exam-16 three weeks earlier.

The school examination, and what it validated

Seemab sat the OPF Girls College First Term Examination in August across Chemistry, Biology, Physics and Mathematics. All four papers were checked question by question against all 65 practice papers. Of 82 question slots, 74 had been set before, 8 of them near-verbatim, including one

chemistry bond-energy question that matched down to the exact three numbers. Every question on all four papers fell inside the studied syllabus.

Two corrections came out of that comparison and both are now acted on. First, the coverage trackers had been avoiding topics judged "over-drilled" (physics theory-versus-law, chemistry Chapters 8 and 9) and the school set all of them; that advice is reversed. Second, the Mathematics paper contained a Unit 10 construction, which we have excluded all year because Seemab has no geometry box. It appeared only as an optional alternative and cost her nothing, but the exclusion is now a demonstrated risk rather than a safe simplification.

The one open read is now closed

MCQ 10 on exam-17 cannot be marked. She wrote a coordinate pair instead of an option letter and overwrote the first number in solid ink; checked at 600 dpi under four binarization thresholds, no stroke structure survives. It was not guessed. Atif ruled on 9 September that it counts as wrong, which is what a board would do with an unreadable answer and which carries the right lesson: on a multiple-choice paper, write the option letter clearly and do not overwrite it. Mathematics exam-17 is final at 43.5/50.

MCQ: 222/246 (90.2%). Exam-21 was a 30-MCQ paper, so Section A carried 30 of its 46 marks; she took 25. Her five losses were the quantum mechanical model, electron affinity confused with ionization energy, the Haber catalyst, diamond's giant covalent structure, and the claim that a catalyst changes the overall enthalpy change. All are recall items rather than method failures.

MCQ: 175/186 (94.1%) after 29/30 on exam-15, her best MCQ section in any subject this year. The gradient-versus-area confusion is resolved: both directions tested on one paper and both correct. Her school's First Term physics paper

set the barometer density question drilled on exam-14 and the theory-versus-law question the tracker had been avoiding as over-drilled.

BIOLOGY: 91.4% | 672.45/736 | 12 attempts

exam-15-ch1-7	21 Aug 2026	39/43	90.7%	A+	

MCQ: 159/168 (94.6%). Unchanged. Her school's First Term biology paper confirmed the Chapter 7 syllabus boundary: it examined only sections 7.1–7.6, with no photosynthesis and no respiration, exactly as her teacher stated in June.

ISLAMIAT (NEW SUBJECT): 65.2% | 30/46 | 1 attempt

Exam	Date	Score	%	Grade	Flag
exam-02-bab1-2-3-4-6-7	13 Sep 2026	30/46	65.2%	B	NEW · FIRST ATTEMPT

MCQ: 17/30 (56.7%), her weakest MCQ subject so far, concentrated in the Bab 3 Fatah Makkah / Ghazwa Hunain / Tabuk / Hajjat-ul-Wida cluster (8 of 11 wrong, Q.10–20) plus two confusable pairs (Q.23 Hasad vs Rashk, Q.25 Hazrat Shifa vs Hazrat Umm Atiya). Sections B and C (written): 13/16 (81.3%), already close to her norm in other subjects. Not directly comparable to Maths/Chemistry/Physics/Biology: this is a first attempt in a brand-new subject, not a regression.

Priorities for the next fortnight

1. Keep writing the concluding sentence. Broken after six papers on Chemistry exam-21. Confirm it holds on the next attempt before calling it fixed.

2. Check the option letter against your own reason. The rough working is now established (60% to 83% to 97%). The remaining leak is transcription: on exam-15 she reasoned to B and wrote A, and on Maths exam-17 she wrote a value instead of a letter and it could not be read. Always write the letter, and check it matches the argument.

3. The product rule for radicals (Unit 1 §1.4.3), still outstanding from exam-17.

4. Chemistry recall pairs. A catalyst does not change ΔH ; electron affinity is the opposite of ionization energy; giant covalent versus simple molecular structure. All five exam-21 losses are flashcard material.

5. A geometry box. Unit 10 is examinable at her school and has been excluded from every practice paper since July.

6. Islamiat Bab 3, Seerat facts. Wadi Hunain's distance, the tribes there, who rallied the fighters, Kaab bin Malik's repentance, the Hajjat-ul-Wida year and Ghadeer-e-Khum: a dedicated re-read of Fatah Makkah through Hajjat-ul-Wida, plus flashcards for Hasad vs Rashk and Hazrat Shifa vs Hazrat Umm Atiya.

Marking method: exam-21 and exam-17 were each marked twice. All 18 questions were re-derived independently from the question paper rather than the answer key, and both passes reached 43.5/50 with no disagreements. The four judgement-based deductions on exam-17 were separately challenged and all four survived. For exam-21 all 30 MCQ answers were re-derived from the printed stems rather than the key, a shift guard was run across five alignments (25 matches at the correct offset against 2, 1, 2 and 0 elsewhere), and both passes reached 41/46 with no disagreements. Islamiat exam-02 was marked from the CamScanner scan: all 30 MCQ letters were re-derived from magnified crops rather than read at a glance, and Q.2(i) / Q.3 (the two hardest-handwriting answers) carry an explicit note in the full report on the small number of words that could not be confirmed to a word-perfect transcript, alongside the graded content, which was confirmed independently on repeated zoom passes.

Version history

- **v54:** identified the "answering less than the question asked" pattern across five papers
- **v55, v56:** incremental attempts, Chemistry and Physics revision tests filed
- **v57** (10 Sep 2026): Physics exam-15 at 45/46; all four repeat physics errors corrected in one paper; the MCQ turnaround (60% to 83% to 97%) documented across Maths exam-17, Chemistry exam-21, Physics exam-15
- **v58** (13 Sep 2026, this version): Islamiat exam-02 added as a fifth subject, first attempt, 30/46 (65.2%); overall recomputed to 92.4% across 53 attempts; MCQ record recomputed to 739/808 (91.5%)

Full lineage v1 through v58 is retained, unedited, in `seemab - reports/`; per the additive-only rule, no prior version is ever overwritten or deleted.

END
